

We have designed our gateway to handle transaction submissions and responses in the Authorize.Net format. We call this our Gateway Emulator.

For example, if your shopping cart or application supports the Authorize.Net gateway, all you have to do is change the transaction POST URL. The Authorize.Net Emulator transaction POST URL is as follows:

(AIM Method)

<https://ap.transactiongateway.com/gateway/transact.dll>

(SIM Method)

<https://ap.transactiongateway.com/cart/ausi.php>

Once you have updated the URL to point to us, your system will submit transactions directly without having to make any changes to your web application's code base.

You will need to configure the Authorize.net AIM payment module with the following credentials:

API ID is your gateway username (testing user is "demo") Transaction Key is your gateway password (testing password is "password")
